# HNAP

## The HAMNET Access Protocol

---

DESIGN OF A RADIO COMMUNICATIONS PROTOCOL FOR HAMNET  
ACCESS IN THE 70CM AMATEUR RADIO BAND

# Contents

---

Motivation & System Requirements

System Design

Implementation

Throughput and delay evaluation

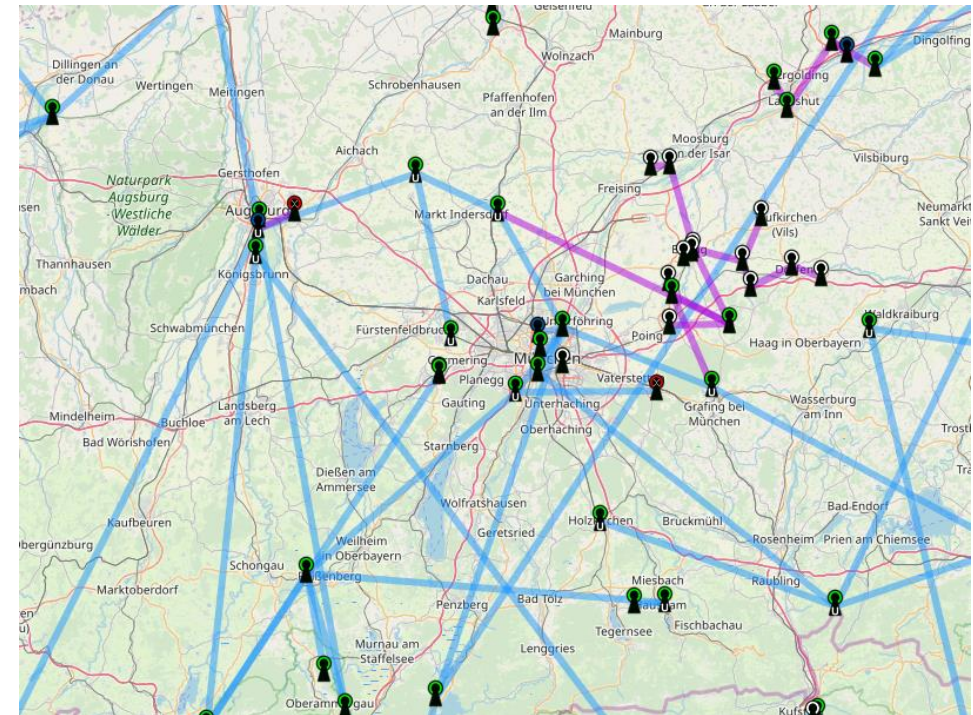

# About Hamnet

Highspeed AmateurRadio Multimedia Network

IP Network separated from Internet

Directional radio link at 2.4GHz and 5.7GHz

Problem: Access requires line of sight to  
HAMNET station

[www.hamnetdb.net](http://www.hamnetdb.net)

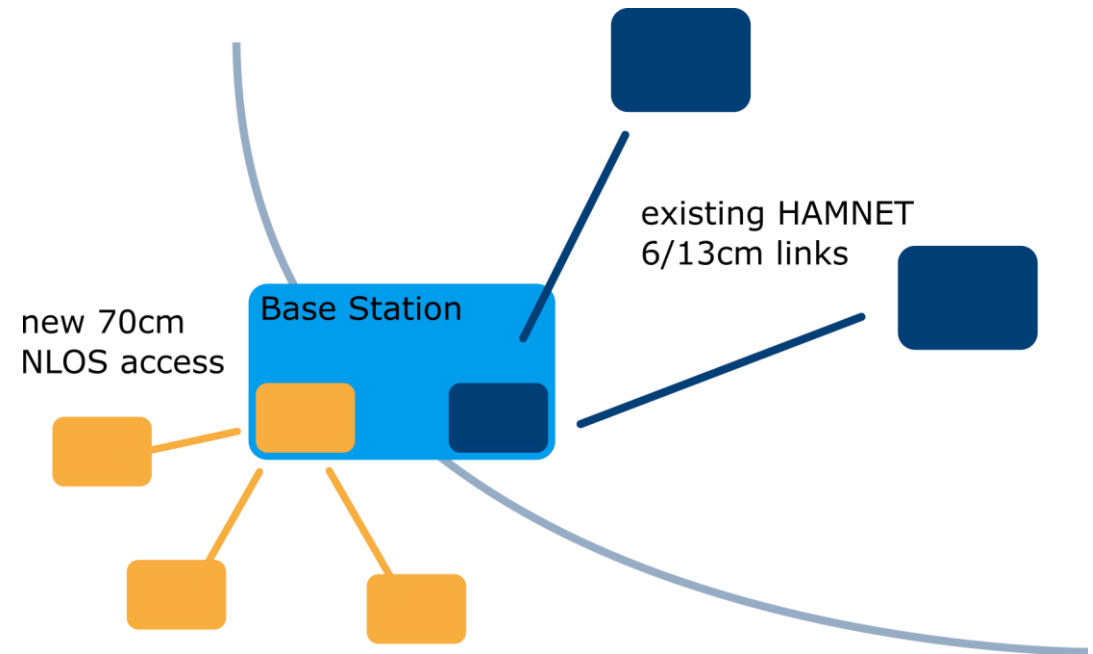

# Thesis Motivation

---

Enable the use of 200kHz duplex channel at 439,7MHz UL / 434,9MHz DL

Provide NLOS access to HAMNET backbone

Extend Network Coverage

# System Requirements

---

VoIP capable: full stack delay <150ms

Adaptive data-rates, higher than existing solutions: >130kbps

Flexible design: scale to other bandwidths

Cheap Hardware

- Basestation <1000€ / client <300€
- Client: only half-duplex

# System Overview

---

OFDM system with 4 kHz subcarrier spacing

- 40 modulated carriers → 160 kHz system bw

16  $\mu$ s Cyclic Prefix to combat ISI

FDD/TDMA structure: slot as smallest resource unit

Modulation: QPSK – QAM256

Convolutional coding

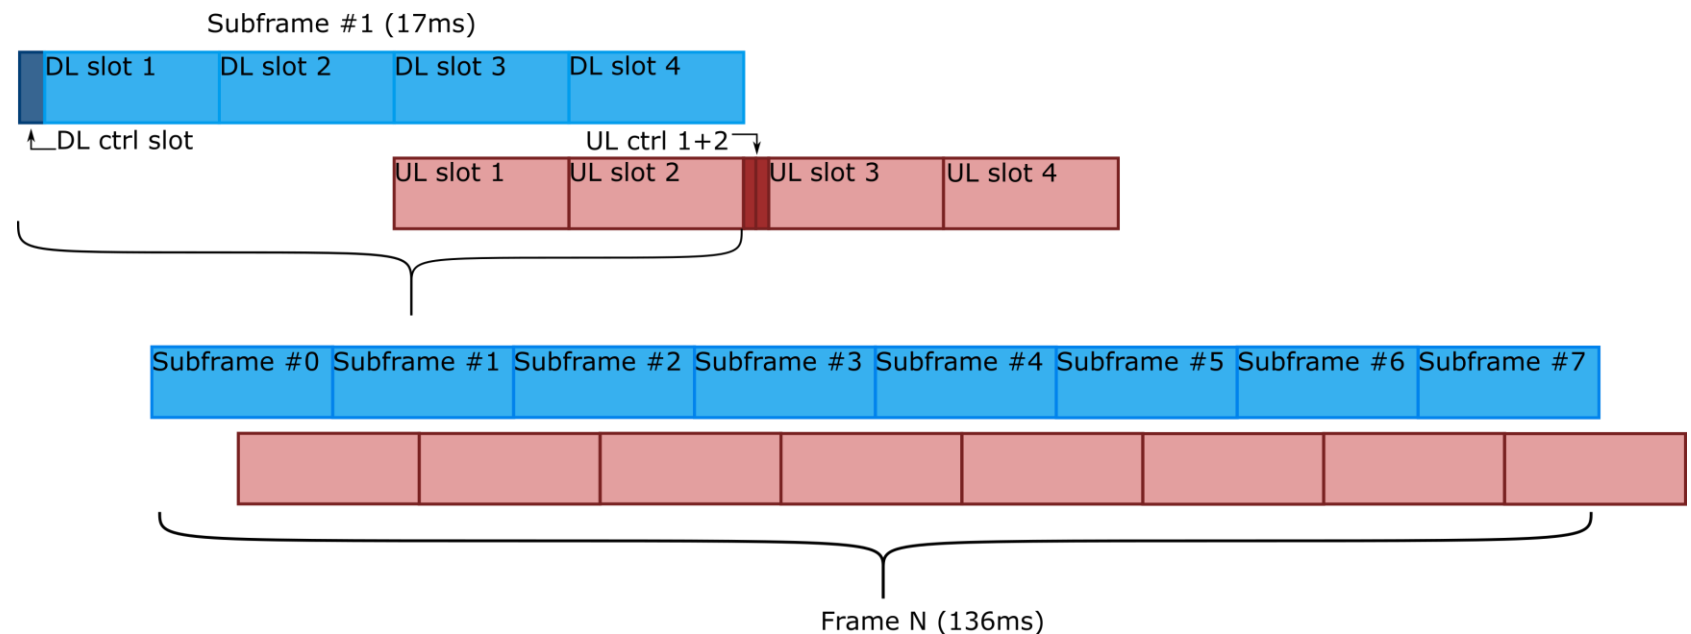

MCS idx	Modulation	Coding-rate
0	QPSK	$\frac{1}{2}$
1	QPSK	$\frac{3}{4}$
2	QAM16	$\frac{1}{2}$
3	QAM16	$\frac{3}{4}$
4	QAM64	$\frac{1}{2}$
5	QAM64	$\frac{3}{4}$
6	QAM256	$\frac{1}{2}$

# Frame Structure

One Subframe (17ms) contains 4 UL and 4 DL data slots

Control Slot in Downlink defines slot assignments

Uplink control slot for resource requests

# MAC Layer

---

At most 14 Users

Accepts Ethernet frames as payload (can use ARP, DHCP, Network bridge from OS).

Users see network as one Ethernet switch

Supports Fragmentation (max 1900bytes frame size)

Round-robin scheduler, scheduling period: 17ms

Unacknowledged mode (ARQ supported but not yet implemented)

# Adalm Pluto SDR

---

Analog Devices AD9363 transceiver

1 RX + 1 TX channel

Tuning range: 325MHz – 3.8GHz

Xilinx Zynq-7000 SoC

- 667MHz ARM Cortex-A9 dualcore
- Small FPGA

512MB RAM

Cost: ~150€

[wiki.analog.com](http://wiki.analog.com)

# Application overview

Written in C using liquid-dsp library

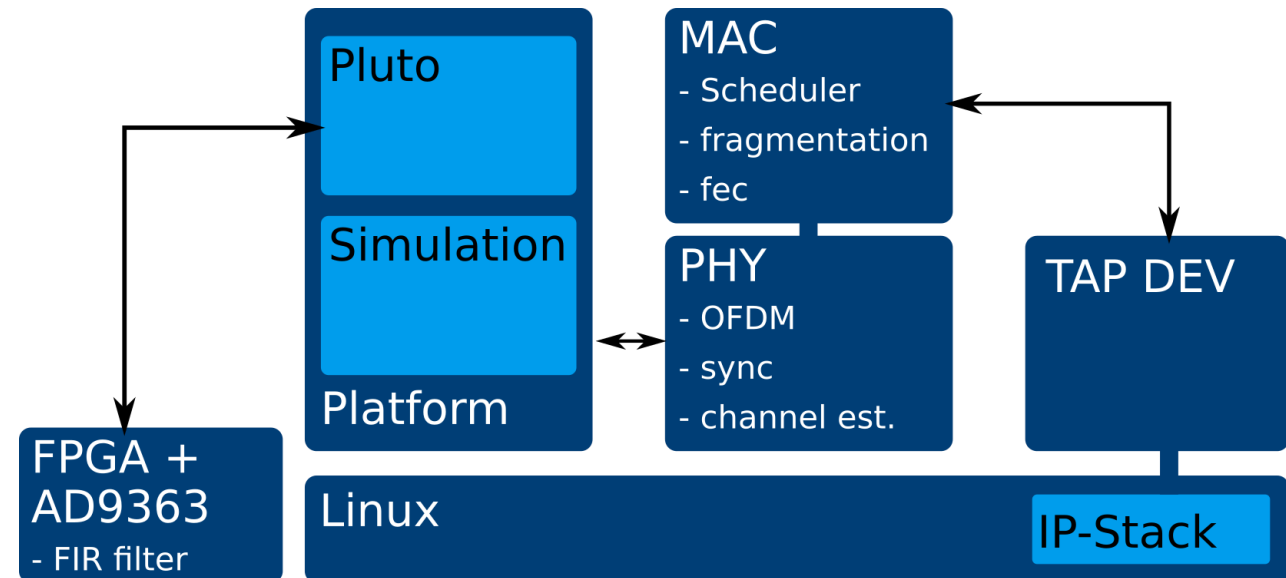

Abstract platform interface

- Simple integration of a simulation environment

TAP device is exposure point to

Linux Network stack

- Ethernet transparency

# Achieving Realtime Execution

---

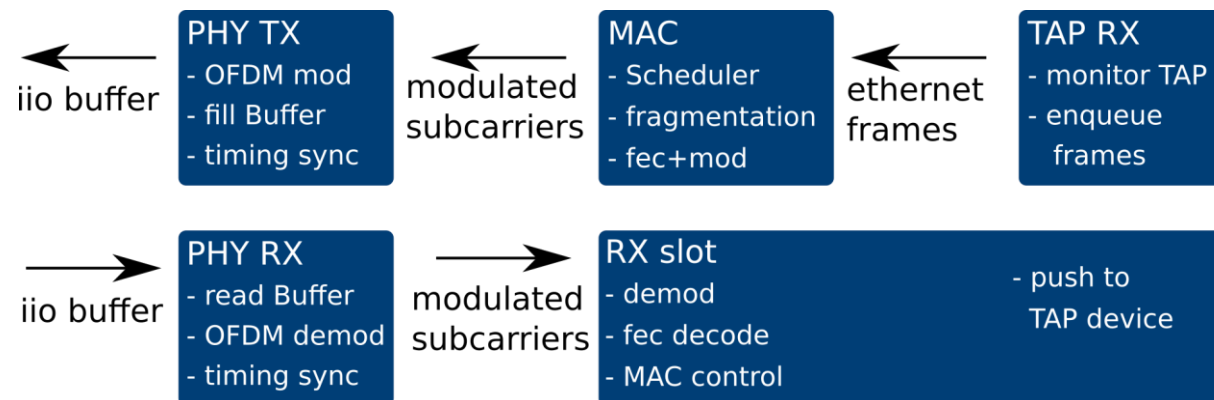

Use Linux RT-patch and Linux realtime priorities

Use pthreads and distribute load across CPU cores

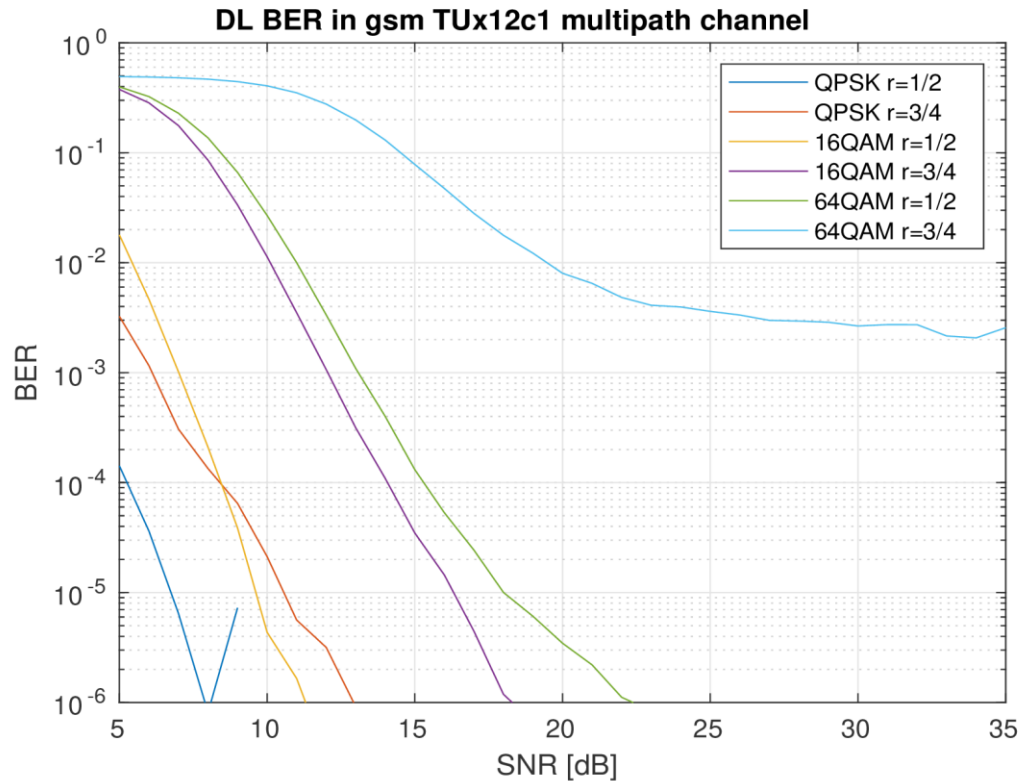

Use isolated core for buffer transfers

ARM Neon optimized Viterbi decoder (3x speedup)

- Ported from libfec SSE2 decoder

# BER Simulation

Static multipath channel

Rayleigh fading channel

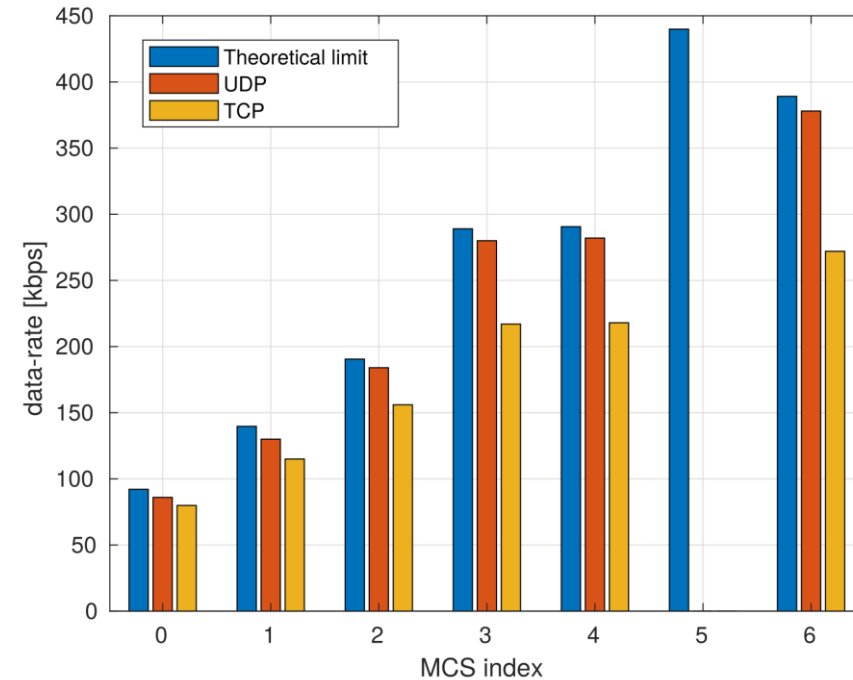

# System Demo

---

```

Throughput measurements

# Conclusion

---

Built a 200 kHz communication system with high spectral efficiency

Short scheduling period at MAC layer makes VoIP support possible

Combining simulation and production code sped up implementation process

TODO:

- Test system with power amplifier over larger distances
- Implement ARQ scheme
